Activation of adenosine A2A receptors in the prefrontal cortex mediates the effects of cocaine on working memory. Previously, it was demonstrated that prefrontal cortical (PFC) treatment with A(2A) receptor agonists enhanced working memory performance in the radial maze. In the present study, we sought to identify the cell types and receptor subtypes involved in the effects of the A(2A) agonist CGS 21680 (CGS) in the PFC on working memory performance. Single-cell labeling of the microinjected cells with fluorogold and the

additional c-fos labeling provide the first evidence that A(2A) receptor activation in the PFC enhances working memory performance in the radial maze via postsynaptic activation of neurons projecting to the hippocampus. Treatment with CGS dose dependently enhanced working memory performance with a full A 2d92ce491b
