Ovarian steroid hormones induce distinct changes in the development of rat myometrium: effects of estradiol, progesterone and their antagonists. Estradiol and progesterone are the principal ovarian steroids secreted by ovulating females during the luteal phase of the estrous cycle. Despite this essential role of these hormones, their mechanism of action has not been established in the uterus. The aims of the present study were to characterize the receptor subtypes for estradiol and progesterone in the rat uterus and to define the *in vivo* role of the respective receptors in the regulation of uterine contractile activity. Estrogenic and progestogenic actions were investigated by measuring the effects of *in vivo* administration of estradiol, progesterone or their respective antagonists on uterine contractile activity. Uterine cyclooxygenase activity and the cellular binding of ¹²⁵I-progesterone were investigated *in vitro* in relation to the steroid treatments. Estrogenic action was observed in rats treated with estradiol and progesterone. Uterine contractile activity was inhibited by estradiol in the mid-cycle, dioestrous phase but was stimulated by progesterone in the pro-oestrous phase. The differential actions of estradiol and progesterone were associated with a change in the relative proportion of progestin receptors in the dioestrous and pro-oestrous phases of the cycle. Progesterone receptor binding was increased in the pro-oestrous phase as compared to the dioestrous phase, while estradiol receptor binding was increased in the dioestrous phase as compared to the pro-oestrous phase. The relative proportion of progestin receptors in the myometrium was also modified by *in vivo* administration of the corresponding hormones. Uterine contractions were inhibited by the progestogenic effects of progesterone and progestin agonists in rats treated with estradiol and stimulated by estradiol in rats treated with progesterone. In conclusion, these results support the existence of differential mechanisms of action of estradiol and progesterone in the uterus, in relation to their receptor subtypes.
