I'd like to use an X display with a resolution of 1366x768 as an output device in a display server. Now, according to the X server documentation, you can connect to a display using the highest available display resolution, so, I'm thinking that if the display server is set up with the highest resolution available, it's going to be blurry, and I'd like to avoid that. I've found the minimum required resolution for a picture to look blurry on a 1920x1080 monitor: The reason I'm asking for the minimum resolution is that, if the display server doesn't have the required resolution, there's no point in setting up the highest resolution available. A: I've tried it with the Xvnc server with the following results (on a Dell E520): if the display server has not the required resolution (in this case, a resolution of 2048x1536) then it's going to be blurry if the display server has the required resolution, the resolution of the server will be the same (i.e. 1920x1080) My tests show that the resolution of the server is always the same, so it makes sense to use the minimum resolution for the X server to work. This invention is related to a non-returnable valve. More particularly, it is directed to a non-returnable valve assembly for use with a steam boiler. Steam boilers of various designs are used for heating or producing steam for a variety of purposes. For example, steam boilers are used for domestic hot water supply, space heating, or in the electric power industry. In most instances, the steam boiler is utilized in conjunction with a feed water heating device that serves to heat the water to be used by the steam boiler. A typical steam boiler is comprised of a chamber containing a furnace and a heat exchanger. Feed water is fed to the furnace where the water is heated and passes through the heat exchanger. Steam is then withdrawn from the heat exchanger and used in a variety of applications. A problem that occurs with steam boilers is that they tend to be messy. Since steam boiler water is a poor conductor, very little steam will
