I'm interested to know what the state of VS2010 unit tests with mono is. I have used it in the past. Last time I used it was actually with the express edition and used against a Windows server. Now I have the full edition and have been using it against my home server, which is running ubuntu 10.04 LTS. When I try to create a unit test against a system that runs on Linux I'm not able to do so without getting errors. Running the unit tests against a Windows machine I've no such issues. I have tried both .NET 3.5 and 4.0 and I get the same errors, so I can't say it's my implementation of the tests that is at fault, but maybe someone else has seen this behaviour before. I'm using the MSTest Framework, in my test project I have a default.testsettings file and a corresponding Configuration file. When I run the tests, I get two errors: System.InvalidOperationException: Could not resolve this reference. Could not locate the assembly 'Microsoft.VisualStudio.TestTools.UnitTesting.Framework'. Check to make sure the assembly exists on disk. If this reference is required by your code, you may get compilation errors. If your service is hosted in Windows Process Activation Service (WAS), you may need to embed the test executable inside your service, and use execution tracing to determine where the test run is failing.
