''' Output files: 1.txt (one-line each) 2.txt (one-line each) 3.txt (two-lines each) 4.txt (one-line each) 5.txt (two-lines each) 6.txt (two-lines each) I'd appreciate some help. A: Use `grep -A3` with `find` to find the maximum column number: `find. -type f -regex ".*(.*)[0-9]{8}.*" -printf '%t@ %p' | grep -o '.*\([0-9]{8}\).*'` Use `awk` to extract the maximum value: `find. -type f -regex ".*(.*)[0-9]{8}.*" -printf '%t@ %p' | grep -o '.*\([0-9]{8}\).*' | awk -F, '{ print $2 }' | sort -n -k2 | head -1` Note that `grep -A3` followed by `awk` and `sort` will cause the output of `find` to be sorted

before the extraction of the header, which will change its value slightly. And after the solution, you can create a new file `mkfile `pwd`/target.txt` and copy the output of this command to the newly created file `target.txt`
