This invention relates to safety restraining apparatus for use in utility vehicles such as all terrain vehicles and like vehicles, which comprise a pair of vehicle front wheels and a pair of vehicle rear wheels which are mounted on their own rotatable hubs for movement relative to the vehicle chassis. In particular, the invention relates to safety restraining apparatus for preventing a runaway condition of such vehicles by maintaining the rear wheels of such vehicles in a stationary condition during high speed forward vehicle movement. The invention has particular, but not exclusive, application to vehicles such as the well known four wheel drive all terrain vehicles which comprise a pair of front wheels each of which is mounted for movement on a respective rotatable hub in a vehicle chassis, and a pair of rear wheels each of which is mounted for movement on a respective rotatable hub in a vehicle chassis. With such vehicles, in which the rear wheels are mounted for movement by respective rotatable hubs on the vehicle chassis, the pivotal movement of the rear wheels during vehicle travel is generally restricted by placing a first rotatable hub with its associated wheel on a first axis which is generally at a right angle to the longitudinal axis of the vehicle chassis, and by placing a second rotatable hub with its associated wheel on a second axis which is generally at a right angle to the first axis. In known vehicles of the type just described, during high speed vehicle movement the pivotal movement of the rear wheels is resisted, even if the pivotal movement is small, by means of an elastic member such as a spring to prevent the rear wheels from becoming disengaged from the rotatable hubs on the vehicle chassis and, consequently, preventing the vehicle from runaway movement. During high speed forward vehicle movement, however, it is possible for a vehicle to become uncontrollably propelled forward due to the fact that the torque applied by the vehicle engine to the vehicle rear drive wheels causes such wheels to act in a direction opposite to the direction of rotation of the rotatable hubs on which such wheels are mounted. One way in which this could occur is for the vehicle engine to become stalled for some reason, thereby applying a reverse torque to the rear wheels and causing them to act in a direction opposite to the direction of rotation of the rotatable hubs on
