Now you can easily get all software and activator. 1. Field of the Invention This invention relates to an improved technique for displaying data to a user in a graphical format. 2. Description of the Related Art It is known for software applications to provide the ability to display a table-like list of data to a user. Often, this data will be returned from an external source such as a database, or may have been edited by the user within the software application. Tables can be useful for displaying a large volume of data, but they do not always lend themselves well to dynamic or interactive display. When data is displayed as a table, all of the data is usually displayed at once, and may be quite large in size, thus making it difficult to distinguish between the various items of the data. Consequently, it may not be possible to easily identify data which is in fact of interest, or which may be part of an overall trend or pattern. An alternative display is to use a "pager", where the list of data is displayed as a list of pages, which the user can scroll through. However, while pagers are usually useful for displaying a large volume of data, pagers can be difficult to use for many tasks, because the user must first learn to scroll through the pages before being able to see what is on the page. Thus, although the pager format is useful for displaying a large volume of data, it is not well suited to dynamic or interactive display. A comparison of water and gas pockets in the aqueous phase of equilibrium partitioning studies. To estimate the volume of adsorbed gas that can reside in the aqueous phase of a binary-phase partitioning system, we determined the fraction of the sample volume occupied by gas as a function of time during an equilibrium partitioning experiment. When the alkyl halide and quinone were perfluorotributylamine and 2,6-dibromophenol, respectively, gas 2d92ce491b
