I'd like to keep the path where the image is saved, but I also want to be able to move the image later on. In other words: If I upload an image to /systems/images/img.png, I'd like to be able to download the image later, later on to /uploads/images/img.png instead. I imagine I'll need to create a new table to hold the new path, and the image itself. This is pretty much the reverse of what's already in CakePHP. How would I go about this? A: Extending the existing Images model might be a good place to start. Rename everything in the model to match your new path structure. \$this->name = 'images'; \$this->useTable = false; //... // Example for renaming your image_file column to filename //... \$model = \$this->Images->getModel(); \$model->renameColumn('image_file', 'filename'); I'm not sure if there is a way to clean up the old path structure automatically, but you can always use a query in the rebuildAll() method to create a temporary array of old path strings from the model. This is a really rough example of how I would do it: \$query = \$this->Images->
