Kaspersky Anti-Virus Plus 8.0.x for Windows Workstations v. 8.0.1.0 Kaspersky Anti-Virus Plus for Mac OS v. 8.0.1.0 Kaspersky Anti-Virus for Mac OS v. 8.0.1.0 Kaspersky Anti-Virus for Android v. 2.6.0.0 In addition, I thought it may be useful to mention that I do not use any anti-virus for Windows OS. As for here's the deal, as mentioned in another answer, things that you may have downloaded in the past are not stored on your computer. Well, except for the registry keys that Kaspersky was possibly keeping. These things are usually stored on the hard drive, but you can delete those just as easily by running gpedit.msc (if you are a member of the local administrators group) or It is however recommended to run a scan on your system, in case there is something to be found there. As far as the name of the files is concerned, that's the name that Kaspersky chose. The file extensions are sometimes indicative of the program that is used to create the file, so in this case it was a batch file. Also, there was a registry key created that is also called kavkey. If you have Kaspersky Anti-Virus 2014, 2014 for example, you might see a key called kavkey which may be where Kaspersky stored the activation key. If you have another version, it might be kavkey.2014 or kavkey.2013. The key looks like this: [HKEY_CURRENT_USER\Software\kaspersky\settings\kavkey] For more information about the registry you can look at this site: Registry walk-through Now, as for the reason why Kaspersky did not detect the key being created, I have no idea. There are many ways the key can be created without Kaspersky having to do anything. It is possible that the registry key was created using other software. Maybe someone at the workplace came across a guide online or something and just created the key. The name of the file may have f3e1b3768e
