☐ In Internet Explorer the keystrokes are sent to the specified proxy address. ☐ In Mozilla, Firefox, Netscape and Opera the keystrokes are sent to the user specified proxy address. ☐ Using the User-Agent (browser) field, the IP address of the User can be determined. ☐ PCMesh Anonymous Web Surfing is designed to avoid IP address leakage. ☐ If the IP address is leaked, the TCP/IP stack will send the traffic via a randomly chosen proxy server. ☐ Randomly selected proxy server location may change from time to time and will be shown on screen. ☐ While the number of proxies server can be changed, number of IPs is fixed. ☐ Each time the number of proxies will be

changed, the current number of IPs will be removed. ☐ Only IP addresses in the address range 5.0.0.0 to 5.0.255.255 are accepted by the Web server, other addresses are rejected. ☐ Proxy IP addresses will be reset after each IPs are removed from the list. ☐ Proxy IP address must be on the same subnet as the PC. ☐ A maximum of 5 days is allowed for the IP addresses to be reset. Caveats: ☐ Proxy IP address need to be on the same subnet as the PC. ☐ The proxy address can only be used when the PC is connected to the Internet. ☐ The IP address is no longer valid if the number of IPs in the address range is updated. ☐ If you use a proxy server with poor connection to the Internet, the time it takes to verify proxies may take a long time. ☐ The number of IPs in the list can only be increased. This is not a problem as the list of IPs is automatically generated from the list of public proxy servers maintained by PCMesh.Q: WebDriver not able to access the node.js server after running it in NodeJS I have been playing around with webdriver, I came across a problem that when I run the example in node.js it says "Error: Failed to find element" Example: driver.get(")
