2.1.2. The Attack Surface of a Computer The threat surface of a computer on the network is the set of interfaces that can be used to attack the computer. It is dependent on the identity of the computer and the access control systems of the computer. The threat surface of a computer on a network can be broken down to the following interfaces: * the interfaces of computers on the network * the interfaces of applications running on the computer * the interfaces of devices attached to the computer The interfaces of a computer are dependent on the internal interfaces of the computer, the operating system running on the computer, the administrative credentials and permissions of the computer, and the hardware components of the computer. f3e1b3768c
