The process of solidification of such alloys results in the formation of a porous surface on the solidified alloy. This porous surface is normally called a casting surface because of its similarity in appearance to the interior of a casting mold. This porous surface of the solidified alloy, as well as, some or all of the casting surface of the molded part, must be removed before the part is painted and/or plated with a decorative or protective metal coating or plating. The removal of the casting surface from the solidified alloy is known as deburring and the removal of the casting surface from the molded part is known as deburring the mold. It is also required that the casting surface of the solidified alloy and the mold surface of the molded part be cleaned before they are plated. It has become common practice to use degreasing agents to clean the casting surface, mold surface, and their various surfaces. Such cleaning agents include liquid organic solvents, such as kerosene, petroleum distillates, chlorinated hydrocarbons, or petroleum based materials. The use of such cleaning agents is in direct violation of the United States Environmental Protection Agency regulations. Because of the hazardous nature of such cleaning agents and the amount of cleaning agents necessary to properly clean the metal casting surface, it has become desirable to

I've played in a live-action game of Fuzion Frenzy before, but this was the first time I played against a human opponent. I always start off in the deep end, but the game is so fast-paced that I quickly figure out where to go. I am going to have to revisit the 'hit A, press Y' method of playing this game. Unfortunately, I managed to eat a bunch of beans from my Spicy Jollof and had to make a trip to the emergency room. I don't think I'll be able to play with a Spicy Jollof in my stomach for awhile. j***** (C)Copyright 1998,1999 SysKnect, * a business unit of Schneider & Koch & Co.
