What is it about? Working with Oracle databases and managing them externally usually implies resorting to a multitude of separate tools and subsequent operations. Having all the requirements for easily handling such a database, all into a single, compact yet comprehensive package might seem unreal. Nevertheless, SQLDetective is here with such a solution, that is packed-full with a large number of modules meant at easing the workload of those who struggle with database management. An extensive number of features on the outside, coupled with a lot more on the inside In terms of handling, the application relies on two main layout components: panels and tabs. When undertaking a database task, there are several normative processes that are imposed, and the app's developers made sure to account for these when developing the layout and its characteristics. The multiple views and editing panels can be moved and toggled, and the upper tab array is set in a logical, step-by-step order. Finding a different task or looking at outputs, statistics or even errors is easy and the app automatically redirects users to the active tab for easier identification. Well-designed dictionary-based help menu, for all those DB novices out there One aspect that might be of particular concern to those who are new to database management and SQL editing is the application's complex nature. There are so many features and modules that novices can easily get "tangled-up" and become confused. Having said that, the app comes with an integrated help menu, which is different from others, in the sense that it offers users a dictionary-based module that allows for easy exploration of the capabilities of each tool, as well as later customization of the said feature, to users' preferences. Consistent software for database management that will offer a plethora of useful modules When it comes to Oracle database management, editing of SQL syntax and working with code analysis externally, this application excels both through its comprehensive set of functions, as well as through its handling. Code Checker is a nifty utility for checking code quality of Oracle, PostgreSQL and SQL Server databases with no need for SQL scripts and no need to be a DBA. It can check your database for syntax errors, basic index and constraint violations, dangerous functions, update and delete statements and more. Code Checker creates a report with a summary of your database check results. You can also import and export reports and use with spreadsheet applications like Excel, Access and SharePoint. The report contains 2 parts: 1) check results - a list of all detected items and 2) details - a list of each detected item with the specific location in your database and a screenshot of the screen. Highlights * Code Checker can check your database for syntax errors, basic index and constraint violations, dangerous functions, update and delete statements and more. * No scripts or DBA skills are needed for running checks * Check results are stored in a text file that you can export to create a report * Supports all Oracle, PostgreSQL and SQL Server databases * The application includes both database and report templates * Supports Excel, Access, SharePoint and more. * Very intuitive UI * Validate database during check - this can be extremely helpful. Validation takes a database backup, creates a script for checking, restores database and after the check is finished, you can even backup the database using the script. * Supports all languages - works with both ANSI and Unicode databases. * XML export for most of the report properties is available.
