I've noticed that in all cases when I tried to use local variables in the Scala REPL, they were terminated by a `;`. If I want to read such variables, I must either use their type name (e.g. `println(z)`, where `z` refers to their name as a string), or use both, e.g. `println(z.toString)`. Is there any particular reason for this? If so, what are the pros and cons of this approach? For example, in all REPLs I tried so far, a (long) snippet of code like this yields the following as output: `scala> val x: Long = 123 x: Long = 123 scala> val x: x.type = 456 scala> x res5: x.type = 456 scala> x :8: error: `;` is not allowed within local variable definitions x ^ A: In Scala the variables are typed, so they can also contain more than one type. For example the variable x: x.type could contain more types than just`
