
Lisrel 9.1 Full !!TOP!! Version Free 35

confusing to the novice), Table 9.1 categorizes the main forms of cross-validation in covariance structure modeling. When the model is stable, the goal is . should be achieved with a relatively small number of tests for the covariance structure (for example, no more than 25), while a high result can be expected. With high model variability, the goal is . should be achieved with a large number of tests, while a lower result can be expected. Since the accuracy of a model is highly dependent on the number of tests performed during validation, it is generally not recommended to run more than 25 proof tests.
