App. 669 (1976) 231 S.E.2d 374 WILLARD v. THE STATE. 52790. Court of Appeals of Georgia. Argued October 5, 1976. Decided November 10, 1976. *671 Cedric W. Pittman, for appellant. Lewis R. Slaton, District Attorney, Joseph J. Drolet, Richard E. Allen, Assistant District Attorneys, for appellee. MARSHALL, Judge. Willard was charged with possession of heroin with the intent to distribute. The trial court granted the State's motion in limine over defense counsel's objections, ruling that the prosecution would be allowed to introduce a prior heroin sale between defendant and an informer. A jury found defendant guilty as charged, and he appeals. 1. Appellant contends the court erred in allowing the prosecutor to introduce evidence of a prior bad act committed by defendant. "Although evidence of independent crimes is not admissible unless its connection with the crime for which defendant is tried is a material issue (Code § 38-1801), '(i)t is the universal rule that where identity is shown, slight facts in relation to the independent crime may be shown on the trial.' [Cits.]" Ellington v. State, 227 Ga. 523, 526 (181 SE2d 273). Such is the situation in the case sub judice. Here, the identity of the defendant was firmly established by the testimony of two witnesses who positively identified him. The evidence of the prior heroin sale between defendant and the informer gave sufficient substance to defendant's identity. Compare Smith v. State, 136 Ga. App. 833 (222 SE2d 6

Anorexia nervosa is characterised by an intense fear of gaining weight and a distorted body image. The onset is usually during the pre-pubertal period. This eating disorder is believed to be linked to a biological predisposition and to various family antecedents. Pathogenetic models implicate a negative feedback circuit in the hypothalamic-pituitary-adrenal axis, the metabolic, cardiovascular and immune systems. The symptomatology of the disease resembles that seen in a number of other medical conditions, particularly schizophrenia, depression, and obsessive-compulsive disorder. In anorexia nervosa, there is difficulty in recognising the appearance of the self and its reflection in the mirror, ego-dystonic symptoms, and difficulties in identifying and dealing with the internal world. In the neuropsychological literature, anorexia nervosa is usually classified as a cognitive disorder, with little emphasis being placed upon the role of the affective components of this illness. The purpose of this paper is to examine the neuropsychological literature of anorexia nervosa and to attempt to provide a better integration of the clinical and neuropsychological literature that has been published to date. It is evident from the neuropsychological literature that there is a need for further research into the cognitive, affective and social aspects of the disease. Export a project as SKP file, creating a new file or overwriting an existing file. i) You can export a project as a standalone file: Open the "3D Drawing Options" menu and choose the "File" "Export" "Export to SKP" option. Click on the "File" "Save As" to navigate through the dialog box to the Export option. In the Export Skp window, choose a directory where you want to save the SKP file (do not add any additional information for e.g.: Microsoft Windows, AutoCAD export etc).
