Developed using C, the engine of TinySegmenter is tuned specifically for the segmentation of Japanese and Chinese characters. Dynamic dictionary construction With the help of this powerful engine, you can build and use your own, custom, dictionary to improve the overall accuracy. Cut-off token types The engine offers full space or half space segmentation. The benefit of the latter is that it does not interrupt the reading of the file (tokens). You can tag the type of token and use it for later analysis. Fully customizable output data You can specify the output type (CSV, TXT, XML, etc.) and the format of the data. You can also specify the type of segmented token. Relevant issues in C# 4.0 Trickiness of the new foreach loop in C# 4.0 Many people are confused about the new foreach loop in C# 4.0. Not only because the loops are more complex, but also because they can create a problem if you try to iterate an object. If you can understand how the foreach loop works with arrays, then you will be fine. If you have no idea how this thing works, then please read on. `var arrayOfType = new int[] { 1, 2, 3, 4, 5 }; foreach (int element in arrayOfType) { }` The foreach loop first gets the enumerator object of the array, then gets the enumerator object of the object array. It then advances the enumerator of the object. Because this enumerator is an object, it will run the loop once. This is different than with an array, which the compiler automatically detects. So for this foreach loop, we are really just saying: Get the enumerator of the array Get the enumerator of the array Iterate through it It works the same way for the object. If you try to iterate the object with the object's iterator, the compiler just writes a normal foreach loop. It will use the object's iterator as if it were an array. In this new foreach loop, you must use an element accessor. This makes the foreach loop work with object as well as array. `var listOfMyObjects = new List { new MyObject(), new MyObject(), new`

Comes with an intuitive and clean interface The program does not require any setup and you can input the desired text or file as soon as you download the utility to your computer. The UI is comprised of two main section, namely the area where you can input the text or respectively the file and the output results panel that enables you to preview and copy the results of the segmentation. You can specify the language to be used, whether you prefer full space or half space segmentation and the type of dictionary to be accounted for in the lower section of the interface. You should know that the app allows you to use the main dictionary, a custom one or both of the aforementioned sources. Permits you to segment content from input text and files The utility is as simple to use as it looks, meaning that you can separate the text so that they are usable in the project you are working on in five simple steps. Therefore, you need to input the content that requires tokenization directly or via a file. The application does not support using both options at the same time. The second step entails selecting the desired language, which can be variations of Chinese or Japanese for TinySegmenter engine. If you want to improve the accuracy of the tagging, then it is recommended you load a dictionary. Afterwards, you can specify the type preferred type of segment character and lastly, hit the Start button to process the text. A tool that helps you segment Chinese or Japanese text content Regardless of whether you are doing text-to-speech synthesis, linguistic analysis, machine translation, simple text processing or information retrieval research, SegmentAnt can lend you a hand. Chinese segmenter Chinese segmenter Chinese text segmentation - Hear Chinese Music: Chinese text segmentation - Hear Chinese Music: In this video we will talk about the basics of Chinese text segmentation and then learn how to find the nearest neighbor of those segments. DISCLAIMER: The information included in this video is not my own. It is the product of many people around the world who struggled in the past to get a good translation of different texts that are easier to spot in my videos. Source: Chinese segmentation may be used to identify a word or character with its meaning. Encoding: Chinese Text Segmentation Machine Chinese text segmentation machine for word breaking, part-of-speech tagging and Named Entity Recognition. As Chinese characters are ideographic, they are difficult to segment. In this project, we try to use deep learning technique to segment the Chinese characters in the text, as the character itself does not have attributes
