Field of the Invention The present invention relates to an electrical connector and a method for assembling the connector. 2. Brief Description of the Prior Art U.S. Pat. No. 8,322,065 discloses a multi-piece header, one piece of which contains a multi-pin electrical connector and the other includes a through passage for the electrical connector. The electrical connector is received in an open end of the through passage and is compressed to expand the connector into contact with terminals within the passage. Thus, securing the connector within the passage and maintaining contact between the connector terminals and the through passage terminals must be accomplished before the header is assembled to another piece. A need exists for an improved electrical connector that can be securely inserted within a through passage, with the passage and the connector being simultaneously secured to each other. An electrical connector includes a housing, a terminal module, and a spring. The housing defines a plurality of terminal receiving passages for receiving terminal modules therein. Each of the passages is of an entrance portion and a passage portion. The passage portion may define a through passage. The terminal module, which has a plurality of contact elements, is inserted into the entrance portions. The spring is inserted into the passage portions for compression, for assuring electrical connection and preventing misalignment between the terminal module and the passage portions.Choose an interest, and you can engage with news, research, and the wider world on matters related to the subject of your choice.
