
Infragistics NetAdvantage For Windows Forms 2010 Vol 3

Infragistics NetAdvantage for
Windows Forms 2010 Vol 3. A: You
can get the professional version of
NetAdvantage for Windows Forms
2009 - Test Volume 1 (Pro) [here](#) The
WFP TestVolume 2 (Pro) is [here](#)
Hope this helps --Adam

The term
“electroplating” refers to the common
process of coating a substrate with
one or more layers of metallic
material by electrochemical
deposition of the metallic material
from an aqueous solution. The
electroplating process is typically
carried out by contacting the surface
of a conductive material, which acts

as an electrode, with the aqueous solution containing the metallic material to be deposited on the surface of the conductive material. The application of an electrical current to the electrode causes an oxidation/reduction reaction at the surface of the electrode to deposit the metallic material on the surface of the electrode. This process is often used to apply a metallic coating to the surface of a metal substrate such as a metal strip, wire, rod, plate or other metal article. The resulting product is referred to as a plated metal article or electrodeposited metal article.

Electroplating processes are often used in the manufacture of printed circuit boards. Printed circuit boards typically include an electrically insulating substrate, such as a resinous base material or a glass reinforced resin base material, a thin layer of metal on one side of the substrate, and copper circuitry formed on the thin layer of metal. The formation of copper circuitry involves applying a photoimageable composition to a surface of the substrate, and patternwise exposing the photoimageable composition to radiation in an image pattern to

selectively cure the exposed portions of the photoimageable composition. The selective curing of the exposed portions of the photoimageable composition produces a relief pattern of cured photoimageable composition corresponding to the desired pattern of circuitry. After the patternwise exposure to radiation, the substrate with the uncured photoimageable composition is immersed in a suitable electrolyte solution and an electrical current is applied to the electrodes of the substrate to cause the uncured portions of the photoimageable composition to be electroplated with

copper. The copper electroplating process begins with the copper surfaces of the exposed portions of the uncured photoimageable composition being polarized to a positive polarity. During the copper electroplating process, copper tends to deposit on the copper surfaces of the uncured photoimageable composition. The plated article is then immersed in an acidic solution to remove the
