Besides its use for drafting and designing, AutoCAD can be used for documentation, modeling, engineering, map design, and building information modeling (BIM) for engineering, building, and construction. These programs have made the process of designing and drafting faster, easier, more accurate, and generally more cost-effective than before. For example, AutoCAD has a shape-defining feature that allows engineers and architects to create models of buildings, bridges, roads, plants, and other shapes. With AutoCAD, these engineers and architects can easily add details such as doors, windows, and staircases. Using AutoCAD you can design, model, and manipulate 2D and 3D objects. This is a very powerful tool, because the software offers tools for every feature an engineer, architect, or designer may need. Let's see in this article how to design and draw in AutoCAD. I've managed to get the code working for finding the square root of an integer, but I can't figure out how to make it work for floating point numbers. Here's my code: `def float_sqrt(x): return (x+0.5)*(x+0.5) def int_sqrt(x): return (x+0.5)*(x+0.5) # Example usage: x = float_sqrt(7) print "x^2 = ", x**2 x = int_sqrt(5) print "x^2 = ", x**2 A: Your int_sqrt(x) function returns a float instead of an int. The floating point sqrt(x) gives an exact result of sqrt(x) which is then being converted to an int by the int_sqrt(x) function. That is why the resulting value of x**2 in the float_sqrt(x) and int_sqrt(x) functions is not what you expected. Use def float_sqrt(x): return (x+0.5)*(x+0.5) def int_sqrt(x): return (x 5b5f913d15`
