The application takes almost no time to install and it doesn't come with a complicated setup that you would need to complete before you can actually use it. It sports a clean and intuitive graphical interface with many nice features at hand. KeyMACRO is a software application designed for analyzing, displaying and visualizing seismic data. In fact, the application allows for the analysis and interpretation of data from any seismic streamer. Easy to use The user interface is designed in such a way as to make the software as intuitive and user-friendly as possible. KeyMACRO is designed to work seamlessly with the compatible data acquisition equipment. It is highly recommended that you work with this application on a computer with an Intel Core™ processor and a working memory of at least 2 GB of RAM. KeyMACRO allows you to process the data provided by the first acquisition device (active receiver). All the data in the file will be processed by the application. Use the KeyMACRO software to visually and mathematically analyze and interpret the obtained data. This is done through its interface. For example, you can carry out a spectral analysis of the velocity-frequency. KeyMACRO uses a high-quality graphical interface to display the analysis. Easy MASW is a software solution that is used for monitoring the content and amount of minerals present in sedimentary rocks, sedimentary rock type, and areas for prospecting for valuable minerals. You can monitor the change in mineral content of the layers of sedimentary rocks on a timeline. Your task The evaluation of mineral content requires an accurate interpretation of seismic signal. By means of surface waves it is possible to determine the structure of the sedimentary rocks and the content of minerals. To determine the structure of the sedimentary rocks you must analyze the dispersion curve of surface waves. By determining this curve you can determine the velocity and then the density of rocks (mass per volume). For the evaluation of mineral content you must determine the velocity and density of sedimentary rock samples. Using these data you can determine the content of minerals. This evaluation of mineral content can be used to monitor the presence of valuable mineral deposits, e.g., gold, copper, and silver. Moreover, the monitoring of the mineral content of the sedimentary rock samples allows determining the area where valuable mineral deposits are. This software solution uses the MASW method, which has been developed for the analysis of surface waves. The development of the method was promoted by Charles Morin and Jean-Paul Roux. The method is based on the phenomenon of surface waves, i.e. the waves formed by the fluctuations in density of rocks in the area of influence of the seismic waves. The method is an important tool for determining the structure of sedimentary rocks and the presence of valuable minerals. The method has gained wide recognition in geoscience, as it allows the evaluation of the mineral content of sedimentary rock samples. For the evaluation of mineral content you must determine the velocity and density of sedimentary rock samples. Using these data you can determine the content of minerals.
