For security reasons you should check the ports and IP addresses your system is accessing and your network. Netty Master is a free utility designed to help you achieve these two goals. Netty Master can be used in two ways, as a stand-alone tool or an add-in to your favorite antivirus. You don't need any third-party software to get the Netty Master Add-in. Simply download and install Netty Master Add-in and run Netty Master. This utility is compatible with the following antivirus, and has been tested and certified by them: – Antivirus works on all versions of Windows, including Windows XP, Windows Vista and Windows 7, and not supported on 32-bit version of Windows. – Netty Master will scan the local and remote systems and emails as it finds them, and the settings you made are remembered until you change them. – For remote system scan only, you can add a computer as a new device, and scan the system remotely. You can also add new IP addresses and ports for remote scan. – Netty Master will automatically open a new window showing the results, making it much easier for you to review them. – You can disable or enable the application via the 'Configure' button. You can import all the settings that you made for each computer to save your time. To do so, select 'Tools' -> 'Options' and 'Import Options'. In the Network window you can select the network type (lan or wan), IP address range, computer name, IP address, port number. The number of computers you have connected to the network will appear in the Total column on the main window. Click on 'Next' button to scan.
