A free and open source software implementation of the FIX Protocol. It can be used without the need of knowledge of the FIX protocol and can be extended to support more features. The implementation focuses on ease of use and absence of limitations, thus leaving the implementation to expand Features: Server - A server is a component that responds to client requests that use the FIX protocol and processes the requests in a cooperative manner with other servers. Such cooperative interaction can be one-way or bi-directional. Each server has its own set of properties that allow it to recognize and process received messages and the responses are sent back to the requester via the server's access port. QuickFix Client - A QuickFIX client is a component of the QuickFIX Infrastructure Library (QLIB) that is capable of sending requests to the QuickFIX server and receiving responses or messages from the server. It is free and open source software. QuickFIX specification has the ability to send requests and to receive responses. The data are sent in messages in XML format. Applications that use the QuickFIX infrastructure can be heterogeneous systems. A key client features is the ability to do connection management and to interact with it. The development of QuickFIX at The University of Texas at Austin has involved a lot of work with code reviews and discussions in order to refine the features. HTTP-based API Binary API A broker agent library which has been presented at the 3rd International Conference of the Centre for Financial Engineering. The paper does a very detailed comparison between the QuickFIX protocol and FIX protocol. FIX 4.0 QuickFIX team have announced the availability of the new version of the QuickFIX specification. This version is designed to take into consideration the feedback which has been collected over the past few years of its development. This year's changes include: Applying the principles of simplicity and openness. Substantially extending the set of supported messages. Making changes to the network layer to make it more tolerant of changes in clients. Fixing some long-standing bugs that prevent some implementations from getting QuickFIX working. Documenting all of the reasons why some messages are not sent or received. Clarity in network address and port assignments. Increased support for a large number of languages. Revising a number of the existing messages to make them more generic or more specialized. Introducing a new object that

QuickFIX is an open source version of FIX, a security standard for financial transaction QuickFIX is completely free, and is known to be easy to use QuickFIX implements the FIX specification, with the addition of many optional components not found in the specification QuickFIX is hosted by the International Organization for Standardization (ISO) QuickFIX is fully tested with Linux, Windows, and Mac QuickFIX is supported on most popular development platforms QuickFIX uses part of the FIX specification to simplify implementation; thus QuickFIX does not require changes in the application code QuickFIX is supported by Microsoft, IBM, Oracle, SAP, and Sun Microsystems QuickFIX is used by financial institutions, exchanges, and large value trading systems It is used by other financial application vendors, vendors of ecommerce and shopping carts, and banking applications Webinars "As a very fresh, long-time PPGA newbie (about 4 months in), I must say that this course is a fabulous introduction for newcomers like me. I'm very grateful for the work and effort the creator has put in the course. I like the way the course presents the various modules and the labs/homework assignments help cement your understandings. I've only started looking at the Packet Framework and simple examples but I already have a few ideas to try to expand upon." "The course was a great introduction to the package. I really appreciate all the work and effort the creator has put into making the course enjoyable to sit and listen to. Looking forward to more." "This is by far the best course I've seen on the Packet Framework so far. The instructor and the other students have really helped me to get a feel for how it all functions. I really think I'm going to love this framework and it's great to know that all of the basic concepts can be done with a simple example."2014 Bay, Calif. Cold Front The back side of the Bay Front a wind from the deep north-northeast with a resultant storm surge. Colder and drier air is circulating inland on the back side. Algae and salt are building up on the exposed shoreline. The storm surge also pushed a large, rare, oceanic white sand back into the open ocean. For more photos of the storm see the previous post. Each record has a single, unique transaction identifier (clientTransID and serverTransID). It also has an eight character string identifying the BFA or BFS version, and an eight character string describing the type of event that generated the record. Each BFA/BFS record also has a sequence number to make it possible to re-instate a transaction without causing any errors. QuickFIX is a simple and small C++ library which provides an implementation of FIX version 4.0 protocol. The library allows to create a connection to a remote peer, send or receive messages, and automate the process of receiving or sending messages using asynchronous sockets in a simple and efficient way. Currently supported protocol versions are: FIX 4.0, FIX 4.2, FIX 4.3. These versions are not limited to any source code. All FIX protocol versions are supported. Each protocol versions is supported with one specific library implementation of the protocol; the QuickFIX implementation is available for those implementing FIX 4.0 and 4.3 protocols. Use of the library is enabled by simply linking against QuickFIX.dll, which usually comes with QuickFIX. There is no requirement to actually ship this file in your application. To use QuickFIX, you must have libxml2 or MSXML2 libraries. Documentation is provided with the library. Besides, QuickFIX implements in its library a collection of predefined classes, for example classes for registration and authorization, for message-encoding, and for message decoding. Why it is a good fit for your business: · Open Source: the library is offered free of charge and is released under the GNU General Public License · Easy to use: everything is provided in DLL that can be integrated into a project by just using 1 line of code · Full documentation available: the documentation is provided with the library · Small size: QuickFIX is a small library which does not require much time to configure and set it up · Highly portable: support for multiple processors including x86 and Alpha Architecture is provided out of the box · Supported protocols: FIX 4.0, FIX 4.2, FIX 4.3 · Usage examples: QuickFIX is a library, not a product. It can be used to send and receive messages with minimal coding required. QuickFIX comes with a set of examples which show how to use the library. Some QuickFIX features: · Automatic configuration · Batch processing · Compatible with .NET and Qt · Support for more than 90000 ports · Single port with multiple flows · Supports real time processing · Asynchronous sockets · Proxy support · Chunk support for message envelopes · Message header and header footer support · Encoded text support · Plain text support •...more Information...
