Vault (metallurgy) In metallurgy, a vault is a casting mould that is usually made from a graphite/epoxy casting resin with a steel insert to prevent leakage. It is used to make castings of monolithic, plate, and shell (tank, autoclave, rotating service) shapes. It can be used as a plug or release flask when used for a conventional pattern.

Vault (computing) In computing, the phrase vault is used to refer to some mechanism that protects data, such as a cryptographic

mechanism, especially one which has so strong a mechanism as to make the attacker's task seem more difficult than is practical. The term vault (or vaulted encryption) is also used when the security of a cryptosystem is in question, especially when this arises because of a lack of understanding.
