AutoCAD is a paid product. The basic price for AutoCAD 2020 is \$979 USD. Autodesk offers AutoCAD student editions, discounted versions of AutoCAD for different companies, single-user and multiple-user editions of AutoCAD. History The design of the AutoCAD program began in the late 1970s. The first version of AutoCAD was a part of an application developed for the then-popular microcomputer known as the Apple II. The program was released on November 3, 1982, for a price of \$795. AutoCAD was originally released on only the Apple II, but was later ported to other microcomputer and mainframe operating systems, including CPM, IBM PC, Macintosh, and IBM OS/2. Since its introduction, AutoCAD has continued to expand and improve. Its user interface has been updated to the current Windows-like graphical user interface. The underlying source code has been completely rewritten several times. Other versions of AutoCAD have also been introduced, such as AutoCAD LT, which is a scaled-down version of AutoCAD that runs on personal computers, especially laptops, and uses vector graphics instead of bitmap graphics. This allows the program to run at much slower speeds, making it easier to operate on a smaller screen, without sacrificing the same precision of the original software. During the first few years of AutoCAD's life, the software was designed specifically for use on microcomputers. However, as the popularity of the software grew, it became apparent that many of the users of AutoCAD were also working on mainframe or minicomputer-based CAD applications. In addition, there was a large number of users of the program who used it to perform drafting on only one device. This led to the introduction of AutoCAD LT (one of the first full-featured desktop CAD programs), and the arrival of the Windows 3.1 version of AutoCAD. In 1984, a version of AutoCAD became available for the first time on a desktop personal computer, running on the Macintosh operating system. This version of AutoCAD was very similar to the version available for use on microcomputers, but the program supported the full Adobe PostScript 2.0 feature set. Also introduced that year was the ability to modify files on the computer system. This ability to modify files was useful for companies, as many of the files created by CAD

I'm planning to base the design on a white background with a dark line on top, and an image (or a pattern) in the middle, let's say a line or a horizontal stripe, that will slide through the device as the user presses a screen-stabilizing button. This looks like this, if you use an image editor: The slide starts on top of a black horizontal line, moving down the screen on the right side, until it reaches the button (in this example a black square). After that the button fades out, leaving only the image above the button, with the "button" moved slightly upwards. The user then slides the device down, and the process repeats. I'm wondering what I should do: Should I implement this with J2ME's Canvas object, which is not "native" and hence doesn't scale automatically? I read a few guides, all of them focusing on actually scaling the canvas, rather than sliding a window through a canvas of fixed dimensions. And the Canvas documentation doesn't even have any information about sliding a window over it, let alone scaling the window. Should I instead use a relative positioned element with the border painted to the desired color (red in the example), move it down and to the right with fixed values, and animate that? This would only work if I can somehow get the relative position of the button, and the desired center of the element. Or should I go for a completely different approach? I've heard of something called a "drag and drop" concept, where two views with different backgrounds (black and white, or say, black and gray) are superposed and I drag the view with the white background over the view with the black background. I would like to understand how others have dealt with this kind of issue. Maybe someone with a more Java-savvy background would be able to a1d647c40b
