Why it persists over time and why there are so many different types of the disease remains a mystery.” MacKay-Lyons and her team have tested genetic changes in connection with the disease’s damaging effects. They sequenced the tumors in order to identify which drugs are best able to target and eliminate specific mutations. Finding out that breast cancer can be found among families that have had the disease for generations makes sense, said MacKay-Lyons, who has been studying a type of breast cancer called Paget’s disease. “Paget’s was one that was much rarer before screening was available,” she said. “So you would see a pretty young woman who had Paget’s disease but not an infant born with it. It was basically someone with a long family history of cancer and no one knew why they got it.” MacKay-Lyons and her team have already studied the genetic changes that are responsible for one form of breast cancer. They found that a small-scale switch in the gene responsible for breast cancer can cause the disease to develop at a younger age or among people with no known family history of the disease. However, there are still many remaining questions, such as whether there is something that would cause most of the disease to develop at a younger age, MacKay-Lyons said. “There’s a whole host of genetic changes that might be associated with Paget’s disease and other forms of breast cancer,” she said. “But because these things are rare and because people have families, it’s very hard to find people who have all the genetic changes. So one of our strategies is to see if we can find where someone has lots of mutations in one gene and less in another gene. That will allow us to look for the gene that causes all the genetic damage.” MacKay-Lyons is also continuing to look at other forms of the disease, such as breast cancer known as papillary cancer that affects older women. Some of these cancers are caused by gene mutations. “Breast cancer appears to evolve from flat epithelial cells to ductal carcinoma, then to high-grade malignancies,” 55cdc1ed1c
