This works great for our local code and for code in SVN. However, when a developer pushes code to the repository and the pre-commit hook runs it seems that the commit is considered "unsigned" and is "rejected" with this error: \$ hg commit abort: unknown option 'pre-commit' What I would like to do is have the pre-commit hook kick off after every code change and do a diff before the code is committed. So even if the commit goes through, I still want to be notified of it. I've looked at hg commitlink --help and this may be the solution I need but what I can't figure out is how to configure this to run after every commit, not just after an initial commit. Any ideas?
