window (see the image on the right). Use the Back button to return to the Bridge window. As you work, you may notice the word "Undo" showing at the top of the right Tools panel. Click it to toggle the button's showing of an undo indicator. You can use the Undo button to reverse any change you make in the image. The button is enabled only when there is a change to undo. In other words, clicking the Undo button reverses any changes that you make; it does not reverse changes that Photoshop made before you started working on the image. If you want to preview an image with just one layer showing, click the arrow next to the Toolbox tool, and choose View/Show Layer Only. You may need to hold down the Shift key while clicking the arrow to open the menu.

[A case of pulmonary alveolar proteinosis caused by cytotoxic CD8+ T cell infiltration associated with chronic hepatitis C]. A 70-year-old man was hospitalized with symptoms of dyspnea and peripheral eosinophilia. He had been treated for chronic hepatitis C for the last 20 years, and was receiving interferon therapy. A diagnosis of idiopathic pulmonary eosinophilia was considered. The chest X-ray and high resolution computed tomography scan showed bilateral pulmonary infiltrates. A transbronchial biopsy specimen showed alveolar proteinosis and pulmonary infiltration of CD8+ T cells. The percentage of serum eosinophils was elevated to nearly 20%, and the eosinophil cationic protein level was elevated to 20 ng/ml. The patient's symptoms resolved following steroid therapy, but the eosinophilia was persistent. We diagnosed pulmonary alveolar proteinosis as a complication of idiopathic pulmonary eosinophilia. Since the patient's condition improved without interferon therapy, we suspected that CD8+ T cells played a major role in the development of the disease.

**Tribirium (gene)** Tribirium is a protein that in humans is encoded by the TRIB1 gene. Function TRIB1 protein is the first identified member of the TRIB gene family, and it contains a ribonucleotide reductase (RNR) domain, one of the three key enzymes in dNTP synthesis. It is also expressed in vascular smooth muscle cells. TRIB1 encodes proteins with two isoforms, TRIB1 and TRIB3, which are crucial for the promotion of T- and B-cell proliferation, respectively, in mice.

Q: no bootable device error in xubuntu 12.10 on grub rescue I am using  
xubuntu 12.10 on my laptop and its was working fine until yesterday,  
when I found my computer freezed. I had to reboot and my computer  
began with grub rescue mode. How could I solve it? A: Have you tried  
holding down Shift while booting to enter the GRUB Menu? This may  
help you to choose the proper kernel to boot on. If that is not an option,  
it means you may need to boot from a Live CD/DVD to run chroot A  
study published in the journal Experimental Neurology has found that  
the majority of people with MS, a neurological disease characterized by  
the deterioration of the brain and spinal cord, will not suffer a relapse  
while they are on treatment. This is the first comprehensive study of MS  
relapse rates on current and first-line treatments. (see Nature Medicine,  
Volume 10, No. 8, pp. 941-943, August 2004). The paper is published in  
The New England Journal of Medicine. MS is a neurological disease that  
involves inflammation in the brain and spinal cord and can lead to a  
variety of symptoms including blurred vision, unsteady walking, muscle  
weakness and paralysis. Most people diagnosed with MS are treated with  
medication to reduce the frequency of relapses and slow the progression  
of the disease. In the study, investigators analyzed three clinical trials  
that tested the effects of three different types of first-line treatments on  
relapses in MS. Based on the results, 31% of those on interferon beta-1a,  
25% of those on the oral drug glatiramer acetate and 16% of those on  
natalizumab (Tysabri(R)) experienced a relapse. These relapse rates

---

were similar to the relapse rates in other studies of patients taking other first-line MS drugs. "The bottom line is that interferon beta-1a, glatiramer acetate and natalizumab reduce the frequency and intensity of relapses in people with MS," said Dr. Christopher Plouffe, a neurology professor at Brigham and Women's Hospital and Harvard Medical School and co-author of the study. "Most patients will not relapse while
