Simple image resizing can be done in other ways such as using the Image resize tool in Illustrator, using filters in Photoshop, using Photoshop's own crop tool, and creating and editing a photo blend, but image resizing is the most commonly used way to resize an image. Using the Image resize tool If you use the standard image-editing techniques, I have listed below the steps you should take to resize an image, but instead, I would recommend using Photoshop's Image resize tool. Q: Simple java web app with jsp to access and store data in database For my college homework, I have to make a simple java web app that will access data from database via jsp and then store this data in database. I have no real clue on how to start this project but I already have a database and set up a jsp with echos to see what is happening. I'm assuming that I need a servlet to access/get data from the database and an API to write data to the database? I have no real experience so any help would be appreciated. Thank you. A: Let's imagine that your database is MySQL database (it doesn't have to be MySQL), you can start this project by creating the three classes. They are the servlets, the model and the dao. And then let's create the data access layer. Servlets A servlet is a simple Java class that will listen on a specific port, this can be accessed to perform some actions. This is the best way to use a servlet: public class TestServlet extends HttpServlet { @Override protected void doGet(HttpServletRequest request, HttpServletResponse response) throws ServletException, IOException { response.setContentType("text/html"); PrintWriter out = response.getWriter(); out.println(""); out.println(""); out.println("Test Servlet"); out.println(""); out.println("Hello World"); out.println(""); } } The data access layer is a hard part. It's the point where, if you are using a database (MySQL), the queries will be. In the example above, you can
