Attention! To simplify the operation of the utility you must call the command line version of Colour Editor, i.e. ColorEditor.exe. The included colour picker cannot work in batch mode. For real bulk processing of large image collections it is recommended to use the command line version of the program. Colour Editor is a lightweight and portable application that can replace colors within BMP and JPG images. It has integrated color pickers as well as support for bulk processing. Even casual users with little experience in graphic editing tools can quickly get familiarized with it. No installation is necessary There are two separate executables in the downloaded package, for single and bulk processing. They can be copied to a preferred directory on the disk or stored on a flash drive to launch the tool on any computer without setup. No new entries are added to the system registry, and no files are created on the disk without your consent. Single and batch processing mode The interface of Colour Editor is plain and easy to use. The only difference between the single and batch modes is the fact that the latter one has a list that you can populate with numerous images from a selected directory to process all files at the same time. It's possible to view the file contents in a built-in image viewer, use a color picker to select any color from the picture using the mouse pointer, as well as choose a basic or custom color from the integrated palette, or directly input the RGB channels if you have this information at hand. Modest utility for replacing image colors The color picker isn't accompanied by a pixel-level magnification tool to get a better view of the selected color. Moreover, Colour Editor looks rather rudimentary and doesn't have more features under its hood. We are also keeping in mind that the developer hasn't updated it for a significant amount of time. Nonetheless, it's functional on later Windows models, simple to operate, and gets the job done. Colour Editor Description: Great program!
