5. **Bring a new group of layers into the workspace by clicking the icon and choosing New Group from the Layer menu**. Layers can be used to create complex effects by grouping them into layers. You can create groups to apply different effects to or use one layer for all effects. For example, you can group an entire Web page into a single layer so that you can easily position text and shapes to the page. You can also layer text and text effects to one another to create text effects that are impossible to do with any other program. The icons that appear in the Create a Group Layer area (Figure 3-11) are your tools of choice for creating and organizing layers. Figure 3-11. The Create a Group Layer icon in the lower-left corner of the Layers palette. You can create new groups from here, edit existing groups, and move and rename groups. You can create a new group by either dragging a visible layer into the Create a Group icon or by first choosing Layer from the icon's menu. 6. **Click the Create a Group icon**. The Create a Group Layer dialog box appears. 7. **Type a descriptive name for the group**. You can create a group named _News_ and then place all the various text layers that appear on the page into that group. You can rename the group any way you like, but group names are unique within the program. When you create a group, a new transparent layer is created that represents the group. 8. **Drag the Background layer into the Create a Group icon, choose the desired layer in the Create a Group dialog box, and

press OK**. Clicking the Background layer (or pressing the spacebar) puts it on top of the new layer. The other layers remain invisible, but the Background layer creates a layer that encompasses all the other layers.

Learn to use Photoshop to create professional quality photos in this beginner's course. What Will You Learn? If you're new to Photoshop and photography, this beginners' course will be a great opportunity to learn Photoshop the right way. You'll learn how to take a photo, import, adjust, and retouch them in Photoshop. Unlike Photoshop's different document types, Elements will use a single type of file called a ".PSD" file. You'll learn what adjustments and effects are available in Photoshop Elements 11 so you can use them to color correct, retouch and organize images. You'll also learn how to work with layers and masks, which are key features of Photoshop that most people struggle to master. When you're finished, you'll be able to: Import photos from your DSLR camera Create and modify layers Open, close and export images Import and edit images using Photoshop elements (only) Use filters and effects to adjust and edit images Use adjustment layers to create custom effects and adjustments. Note that you won't learn Photoshop's many advanced tools. If you want to learn them, you'll need to purchase the traditional Photoshop applications. Learn Photoshop with the easiest way to learn How to Use This Course We have designed this online course to be flexible. Our goal is for

you to experience Photoshop as you learn in this course. Of course, you can simply take this course to learn what you need to know. Alternatively, you can watch each lesson and skip the ones you don't need. Our course has eight lessons and 2 hours of video. The lessons are designed to be completed in order as they were designed, but you can watch the lessons in any order you like. If you enjoy this course, we hope you'll consider buying a print or eBook of your own from our main website for this course at a discounted price. The Bonus: Assignments and Workshops We have one bonus available to you after you complete this course: When you join us on our Facebook group, you will access our Dropbox link that will contain two one-hour online 1-to-1 consults with our professional photographer and Photoshop expert Connor, to walk you 388ed7b0c7

Effects of retinoic acid on the morphology of immortalized granulosa cells. Epithelial-mesenchymal interactions play important roles during follicular development and in the formation of fluid-filled luteal cells. In the mouse ovary, granulosa cells undergo multilayering when cultured in medium that mimics serum. When retinoic acid (RA) is included in the culture medium, granulosa cells develop a polarized morphology in which the basal third of the cell layers is laminin-rich and tight, and apical third forms the primary cilia. The purpose of this study was to determine whether follicular stimulating hormone (FSH) and/or epidermal growth factor (EGF) are required for the RA-induced organization of granulosa cells. Immortalized granulosa cells were cultured with FSH or EGF in the absence or presence of RA for one or three days. Cells were examined using immunohistochemistry for the actin cytoskeleton, laminin, clathrin, and tight junction proteins. The addition of RA to granulosa cell cultures induced an organized arrangement of cells on the two-dimensional surface of tissue culture inserts. Retinoid-treated cells were tightly packed, and most were polarized. Laminin was localized to the basal surface, and the tight junction proteins ZO-1 and occludin were found in the apical region. Addition of either FSH or EGF induced organization of granulosa cells, but the retinoid-induced cell polarity was not maintained in the presence of growth factor. Despite the change in morphology, the specific organization of tight

junction proteins was not achieved. These results indicate that RA induces laminin accumulation and polarity in granulosa cells, and that this effect is growth factor-specific.

human neuroblastoma SH-SY5Y cells. An increasing body of evidence suggests that tricyclic antidepressants (TCAs), including imipramine (IMI), might have neurotoxic effects in humans. To evaluate the cytotoxicity and apoptosis induced by TCAs, we performed MTT assay and Annexin V-FITC/PI staining in IMI-exposed SH-SY5Y cells. IMI was cytotoxic in a dose-dependent manner with an EC50 value of 17.4 microM. Furthermore, incubation of IMI (10, 20, or 40 microM) for 48 h induced apoptosis, as determined by Annexin V-FITC/PI staining. The induction of apoptosis was associated with cytoplasmic aggregation of phosphatidylserine and cleavage of caspase-3 and PARP. Apoptosis and the corresponding molecular changes were not
