Early versions of Adobe Photoshop Adobe Photoshop was introduced in 1987 as a "raster graphics editor." The first version was Adobe Photoshop 1.0, which was distributed by Adobe on CD-ROM. The program was distributed in the form of 1.x and 2.x versions. The 1.x version was the first version to allow for raster images to be edited on the system's hard drive. The 2.x version included the ability to edit vector images. It was also introduced as a 50-megabyte (MB) floppy disk. By comparison, today's standard sizes are about 4 GB and 16 GB. Adobe Photoshop 3.0 was the first version of Photoshop to ship for PCs. The release of Photoshop 3.0 in 1989 was heralded by a new feature called "scissors," which allowed for scissors to be added to the image and moved to any part of an image. Technically, this was the first version of Photoshop to use a raster file system; however, it was a low-level system that used the Xerox Documented Graphics Interface (XDGI) file format. It should be noted that this version also introduced the Blue Channel, which added a bit of transparency to the image in a way that laid the foundations of modern transparency. Photoshop 3.0 was a point-and-click program that was used by designers. It required users to type or select from a list of colors and other artistic elements, then use the various tools to apply them to the image. With the release of version 3.0, Adobe enhanced its existing document production system with the Page Setup and Print dialogs and introduced a new interface for producing printed pages. The Page Setup dialog was designed to allow users to organize the page setup of a document, while the Print dialog was designed to help users output the page(s). After the creation of these dialogs, Adobe added third-party products such as the Page Setup dialogue to produce printed pages. Photoshop 4.0 was the first version of Photoshop to ship on the Macintosh. It was designed for Macintosh users and was shipped on a CD-ROM. At the time, this was a significant milestone. The release of Photoshop 4.0 was heralded by a new feature called "Snap." The MacIntosh version of Photoshop used a mouse and a grid. When the user hovered over an object or part of an image, the user

Using a brush tool, you can paint any layer. Using this layer, you can then use the Brush tool to paint a different color, or to add or subtract pixels from the layer. You can also use the Brush tool to paint a copy of the pixels you have selected. You can then use this new layer as a mask for other layers you have selected. For example, you can paint the skin of someone on a photo and then paint shadows and lights on the layer. You can then paint out those parts of the layer so that they are not visible, and the rest of the layer is visible. You can then use this layer as a mask for the next layer. To paint and brush your way to success in Photoshop, you need to familiarize yourself with the different brush tools and brushes and use the features of each tool and brush to its fullest potential. Layers Creating layers is a crucial skill in Photoshop, and the ability to use layers efficiently and properly is essential for graphic artists and photo retouchers. To save time, you can use layers to combine multiple files into a single image. You can then use a layer mask to erase and change parts of a photo by painting the layer mask. Understanding how to work with layers is essential when using the features of Photoshop. Photos and documents typically use several layers of information or elements. For example, you might have a layer for the document text, a layer for the image, and a layer for the background. You can then paint the background in a different color and use a layer mask to change only the background. Or you might have a layer for the image, and a layer for the shadow, and a layer for the highlights. You can then paint the highlights and shadows separately and use the layers as masks to eliminate some of the shadows or to add highlights that were part of the image originally. You can use layers to combine multiple parts of an image. For example, you can use a layer for the face of a person and another layer for the clothes. You can use these layers to mask out the clothing and paint the face with black and red paint. You can then use the masks to paint in the clothing and paste the image into the body of someone. You can then use a layer for the hair and mask it to paint out the hair so that all of the hair is black and the rest of the face is red.
