Q: What is the difference between garlic powder, garlic & salt, garlic salt? Is there any difference between the three? What are the ideal proportions? A: The actual difference is that "Garlic powder" is the purest form of garlic -- nothing added, pure garlic. The more common form, "Garlic and salt", is like salt and sugar -- half garlic, half salt. The ideal ratio is about half garlic and half salt -- if the recipe calls for 2 tsp or 2 tsp garlic powder, you don't want to bump up the salt. You can also find a few other versions, like "parmesan garlic salt", "garlic and paprika", etc. If you are cooking with fresh garlic, use a ratio of 1/3rd fresh garlic to 2/3rds salt. A: Garlic salt (sometimes just garlic salt) is pretty much just salt and garlic. It's really just for flavor. As an example, see the recipe for Garlic Bread. The first step calls for 1 1/3 teaspoons of garlic salt, which is almost half a cup of garlic salt. Garlic and salt is half garlic and half salt. Another good example is Garlic Mashed Potatoes. The recipe calls for "2 tablespoons garlic powder" and 2 tablespoons of table salt. So really, half a teaspoon of garlic powder and half a teaspoon of salt. Garlic powder is more like sugar than salt. It is not always an exact ratio but a direction (a + is more garlic and a - is less). It also tends to contain a lot of other stuff as well. Some of this is additives, which I personally don't like (sugars or starches is a good example, although additives are additives). Garlic powder should be used to flavor foods, so try to avoid buying food storage bags that say "vegetable(s)/spices" on them. I have seen a few of these that are "food safe", and they can be used for cooking. If you buy them you can be pretty sure you don't need to worry about "emulsifying" anything in them. Go to search for "garlic salt". There is also "garlic powder". This may list other types of garlic products, but that should be

An orthographic stage of N400 latencies: it is not a response to invalid word letters, as previously thought. Based on known characteristics of the N400 component, an auditory word-oddity effect as well as an orthographic position effect have been found in the latency of this component. These effects, however, do not exclude the existence of an orthographic stage of the N400. Therefore, the present study was undertaken to test whether in fact the orthographic stage of the N400 component would be found. To this end, 16 subjects were presented with sequences of a word and a pseudoword. Each of the sequence components was made up of one to three letters differing from the preceding element of the sequence. When the preceding element was a pseudoword, N400 latencies were found to be dependent on the number of letters differing from the preceding pseudoword and on the position of the letters in the sequence. This pattern of results is consistent with a model according to which N400 latencies were due to the parallel processing of orthographically related letter chunks. The assumption that the orthographic stage of the N400 latency contains contributions to processes that may be involved in semantic judgment but are unrelated to the N400 latency further supports the notion that the process generating the N400 is rather general, with several functional facets.1. Field of the Invention This invention relates generally to the art of polishing stones, and more particularly to apparatus and method for polishing the crown of such a stone. 2. Description of the Prior Art One of the principal steps in the fabrication of many products, such as cutlery, jewelry, mirrors, and tiles, is the turning of one or more stones into a finished product, such as the crown of a gem. Often this is done in the context of a similar step to produce a final product that has a higher quality than a mere raw stone. For example, an uncut stone may be cut into faceted gemstones, or a raw or uncut stone may be machined into a sinker which is then polished to a point. Similarly, a raw stone may be shaped and cut to a selected configuration and then polished to the desired finish. For purposes of brevity, in this description, the steps of turning one or more stones into a finished product will be referred to hereinafter simply as polishing. In the polishing of stones, it is desirable to achieve a uniform and predictable polishing action with a minimum of down-time. One
