Why Do We Need To Talk About STIs? The following excerpt is taken from an article by Robert Wise, a psychiatrist at Johns Hopkins University, "Ten Facts About Sexually Transmitted Diseases." Sexually transmitted diseases are common and, in the United States, mostly preventable, says Robert A. Wise, MD, director of the university's Center for Sexual and Gender Diversity. "We have seen a threefold rise in the number of cases of new genital-genital and anal-genital HPV [human papillomavirus] infection since 2001." And the Centers for Disease Control (CDC) has published estimates that about three-fourths of sexually active people in the U.S. will get at least one sexually transmitted disease at some point in their lives. Why are sexually transmitted diseases (STDs) so widespread? STDs are a public health problem because they transmit infection by direct contact or contact with infected bodily fluids. It's that direct, close contact that allows STD bacteria and viruses to be spread quickly. All STDs are caused by viruses, bacteria, and parasites that can be spread by contact with the genitals, rectum, mouth, or eyes. In women, sexual intercourse is the most common way of transmitting the STD human papillomavirus (HPV), as well as herpes and chlamydia. In men, oral-genital contact is the most common route of transmission for sexually transmitted gonorrhea, chlamydia, and HPV. The CDC lists the following STDs as leading causes of illness in the United States: Chlamydia is the leading bacterial STD in the United States. Chlamydia and gonorrhea are not curable and are often transmitted during pregnancy. Trichomoniasis is often spread by sexual intercourse and does not show any obvious symptoms. As Wise explains, "Anal-genital HPV has been increasing rapidly for the past 15 years." He attributes the rise in new cases to the vaccine for human papillomavirus (HPV) having been approved in 2006. Most anal HPV infections are acquired during anal-oral sexual contact and are spread by direct genital-genital contact and semen. High-risk HPV strains are the same as those that cause cervical cancer and the most common cause of anal cancer, but they often cause no symptoms. In women, the HPV vaccine prevents infection by genital

Anti-muscarinic allosteric modulation of M2 receptors and M1 receptors-mediated responses in the cerebral cortex of rats. The actions of AF-DX 116 ((+)-N-[(3-[2-[(diethylamino)-1-pyrrolidinyl]-1-oxopropyl]-2,6-dimethylphenyl]-1,2-dihydro-6-methoxy-2-naphthyl)-amide fumarate) on isoflurane-induced and K(+)-evoked transmitter release in the cerebral cortex of the rat were studied. The antagonists of M1 and M2 cholinergic receptors, 4-DAMP (4,4'-diisothiocyanostilbene-2,2'-disulfonic acid) and methoctramine, respectively, and AF-DX 116 markedly attenuated isoflurane-induced release and this effect was blocked by pirenzepine, a putative M1 receptor antagonist. In contrast, 1-naphthylethylcholine-induced release was inhibited by pirenzepine, but not by 4-DAMP or AF-DX 116. Neither 4-DAMP nor AF-DX 116 affected K(+)-evoked glutamate release from synaptosomes. The action of AF-DX 116 on isoflurane-induced release was reversed by (+)-MK 801 [1-(2-pyridyl)-N-[(1-dimethylaminoethyl)cyclohexylcarbamate]-1,3-dihydro-1-(2-M)pyrrolidinyl benzodiazepine], which is a positive allosteric modulator of the M1 receptor. The M1 receptor selectivity of AF-DX 116 was confirmed because it competitively displaced (3)H-(S)-quinuclidinyl benzilate from cortical membranes prepared from M1 (-)-chloro-n-homopiperidinium iodide-preincubated rats. The effective concentration (pK(B) value of AF-DX 116 was 9.1. These results suggest that, like M1 receptors, M2 receptors are coupled to G(q) protein in rat cerebral cortex and that M2 receptors allosterically modulate the M1 receptor in the rat cerebral cortex.Q: How to get json response
