Some users say that Photoshop isn't necessary for all photographers, but that being able to do anything in the program, even relatively simple edits, is a useful skill to have. In this chapter we'll take you through the Photoshop editing process, from beginning to end. We'll show you how to create a simple portrait and how to alter it. We'll also demonstrate how to create a photographic lighting study and then change the light source on an image. We'll also use the Clone Stamp tool to remove unwanted parts of an image. A Few Basics: Raster vs. Vector Photoshop is made up of layers. A layer is essentially an image that exists by itself. It looks like a file that you can save to your computer. You can add and remove layers, move them around, copy and paste them, and even combine them. Layers do not physically exist in an image on your hard drive. You have to create them in Photoshop, and layers work the same way on any type of computer. In fact, you can open a Photoshop document, save it, then change your computer, and that saved document will remain unharmed. The other way that you can use Photoshop is as a vector-based program. A vector graphic is where you draw and manipulate shapes using a program like Illustrator or CorelDRAW (see Chapter 3). It's often called a vector image because it's pure shape and no actual raster images are created. (Every image file that you save in Photoshop is a raster image.) You can create a vector image and open that in Photoshop. You can manipulate it there and it will look the same as it did on the other program. Photoshop is a hybrid. You can work with images as vector graphics in Illustrator or in CorelDRAW and you can manipulate those shapes in Photoshop. It's all about how you want to get your job done. If you're a professional looking for quality, then the only way to get quality is to work with actual raster images in Photoshop. If you're a hobbyist looking to add a personal touch to an image with a change of perspective, then the best way is to create a vector image and then work with that in Photoshop. Chapter 3 shows you how to easily create vector images. Getting to Know the Menus Figure 1-1 shows the Photoshop user interface and some of the options available to you. Notice the four main areas of the interface:

## What's New In Download Photoshop Free For Windows 11?

In motor vehicles, there is a trend for ever more sophisticated automatic operation systems for the driver. An increasing number of future driver assistance systems for the driving of motor vehicles are to be found, for example, in addition to the well-known light functions of headlamps, tail lamps, fog lights or parking sensors which are customary in vehicle lighting systems. The aim of such driver assistance systems is to support the driver in driving the vehicle, for example, to indicate via a head-up display the current position of the vehicle at the position of the driver's head, so that the driver is able to observe the vehicle's surroundings without looking down on the foot pedals. Information such as adaptive speed control, slip control, vehicle stability control, collision avoidance systems, and the like are to be found, which support the driver in this manner. In order to be able to supply the driver with a sensory perception of the vehicle's surroundings, what are called "blind zones" or "blind areas" arise, which it is not possible to observe with the gaze of the driver. Such blind zones, for example, are present in front of the driver between the vehicle and the next vehicle traveling in the same direction (upstream and/or downstream) or objects near the vehicle, for example, on the side of the vehicle or on the rear or front sides of the vehicle. To be able to observe such blind zones, a system for monitoring the vehicle's surroundings in the form of a camera and an information processing device can be provided in the vehicle, for example. This visual impression can be output via a head-up display and can additionally be superimposed on the actual view of the vehicle's surroundings by means of a representation of the blind zones on the screen of the head-up display. The driver then receives in this way a sensory perception of the vehicle's surroundings which arises due to the superimposition of the vehicle's surroundings via the camera on a real-time picture of the actual view of the vehicle's surroundings. An information processing device for a vehicle camera system is, for example, described in German Patent Application No. DE 10 2004 044 435 A1, which shows that a camera is used for capturing a real-time picture of the view of the vehicle's surroundings in order to display the current vehicle position on a head-up display. Furthermore, it is known that a display unit for the superimposition of a representation of a region of the vehicle's surroundings can be used in order
