An image that's been photoshopped tends to have a "fixed" appearance. That is, it has specific boundaries and focal points where features appear to have been set in place and anchored. The original artist/photographer cannot change these boundaries and focal points once they're set. Different from other image editing programs, Photoshop gives you the ability to create and alter a raster file. A raster file is a bitmap, or digital image, that's stored as a series of pixels. Photoshop uses layers to edit the pixels. A layer is composed of several elements. A layer is a collection of objects that, when applied to an image, add something to it. Layer elements act like filters on top of each other and affect the image in distinct ways. Photoshop provides a series of controls to alter the appearance of an image. These controls make it easier to manipulate the image with precision. The standard controls that come with Photoshop's most sophisticated tools are as follows: ****Move, Rotate, and Zoom:**** These control the position of the layer on the canvas. It offers you many ways to move and place the layer on the canvas. It also allows you to scale and rotate the layer in order to adjust the size, size, and shape of the layer, and the canvas. ****Arrow Keys:**** The Arrow Keys allow you to move and rotate layers with precise precision. ****Grid and Guides:**** The grid is Photoshop's most powerful tool for guiding the placement of objects on the canvas. The grid is also a very important part of moving, rotating, and scaling objects. This tool is great for precise editing. It can also be used for general placement, but it's more complicated to use. The guides are set on the edge of the canvas and provide a visual reference for objects placed on the canvas. The guides can be moved, and they're handy to have at hand when working with the placement of text or other objects. ****Blending Modes:**** The Blending Modes allow you to move an object in front of or behind another object. Sometimes an object needs to be moved on top of another object or behind it to correct and fix any problems with the image. The Blending Modes allow you to do this easily. For example, you can move a layer over another layer. A layer can also be moved in front of another layer to make it appear to be a different object.

Q: What could cause the full screen to not work when a video plays? I have a Lenovo X1 carbon. In Chrome, when a video plays in full-screen mode, it goes full-screen properly until the video ends. When it ends, it goes back to windowed mode. Does anyone have any suggestions to try to get it to work properly? A: The likely problem, is Chrome is trying to call the autoplay flag in HTML5 video elements with no MIME type specified. This flag was introduced in the 2014 HTML5 specification and only made available in Chrome in early 2016. The browser is setting the autoplay to false in this situation because the mime type is not marked in the data URI. You can work around this by adding the MIME type in the data URI. For example this will start a video in fullscreen mode in Firefox, Chromium and Chrome without autoplay: Q: How to reinstall c-ares? I tried to recompile a c++ program which made use of c-ares for a function which required localhost lookups. Afterwards I tried building c-ares, but I got this error: ./configure: line 2157: 7406 Abort trap \$MAKE I'm on xubuntu 12.04. If I try compiling with --disable-ares, I get: -lutil -lresolv -lc-ares missing link? [cares.a] and I get the same output when I try installing libcares3: sudo apt-get install libcares3:amd64 Reading package lists... Done Building dependency tree Reading state information... Done E: Unable to locate package libcares3 A: Answering my own question.

Q: How to resize a WMI-based COM object I have a WMI COM object that is meant to be used in a macro. This macro will run on every file loaded into a given directory on my machine. I can get the initial file list with the command GetFiles("DirectoryPath"). After the GetFiles(), I would like to use wmiDataObj.Get(...) to get each file and resize it with resize. For ex: MsoImageHeight = wmiDataObj.Get("ImageWidth") So, I was just wondering if there are any good solutions, either without VBScript or just for creating VBScripts, to get the current width/height of these images and then resize them to a smaller size? The data that I'm working with is not very big, so I can just use a loop and resize down to a suitable size. A: I created two VBScripts that get the job done. Here is a VBScript that simply queries the image width/height from WMI. Function getImageWidthHeight(objWmiClass,objPath) Dim objWMIService Dim objFso Dim objSubFso Dim objSubFsoObj Dim objFileInfo Dim objPathArr Dim objFSO Dim objFile Dim objRdr Dim objObj Dim objInStream Dim objOutStream Dim objSI Dim objSIObj Dim objImage Dim sImagePath Set objWMIService = GetObject("winmgmts:\\.\root\cimv2") Set objSubFsoObj = Nothing Set objSubFso = Nothing Set objFileInfo
