DATE: September 30, 2012 DETAILS: On any given night at the Chase headliner cities all over the country, thousands of collegiate-aged fans turned into partygoers for a night of fun and fireworks. Student tickets have sold out for Chase events for many years now, and the idea of a weekday ticket to get a headlining show might sound like a pipe dream to fans of other teams. But as you were dreaming of scoring a night out this Saturday night with your fellow students, just remember – in some cities around the country, there is a chance that your favorite team might be playing in the late-game. And if your favorite team is staking its claim as a true contender for the national championship, chances are the tickets to the Chase are in shorter supply than your school's football team. After the SEC, the Big Ten is the second-most-entertaining conference in college sports, and the Chase headliner events are a great way to get in on the action if you're not able to hit the road. If you don't have tickets, maybe playing the game yourself is your best bet. For details on ticket availability to this weekend's Big Ten events, check out Chase.com/collegefootball.Genetic backgrounds of starch-accumulating mutant mutants in rice and barley. Starch accumulates by photosynthesis when CO_2 assimilation is activated during the day. Starch accumulates in amyloplasts in storage parenchyma cells in leaves when photosynthesis is stably inhibited. Two separate mutants (osaka1 and cs3) in rice and three mutants (bck(1), bck(2) and sbc(2)) in barley accumulate starch in the amyloplasts in starchy internodes when photosynthesis is stably inhibited. A genetic map of starch-accumulating mutants was constructed. Analysis of the rice mutants revealed that two genes controlled starch accumulation by different regulatory mechanism. One of the genes controlled starch accumulation in both parenchyma cells and in endosperm cells by coding soluble starch synthase II that catalyzes the initiation of starch synthesis. The other gene controlled starch accumulation in parenchyma cells but not in endosperm cells by coding soluble starch synthase I that catalyzes the elongation of starch chains. The barley starch accumulating mutants were mapped to D-genome region on the group I chromosomes, which contained the genes for starch

The present invention relates to a method for providing an O-isopropenyl alcohol in an industrial scale, and more particularly to a method for producing an alcohol by reacting isobutylene with water in the presence of a solid catalyst. According to the present invention, an organometallic complex or a salt thereof is used as a catalyst. Here, the organometallic complex is illustrated by the following formula, the salt is illustrated by the formula: wherein X_1, X_2 and X_3 each represent a halogen atom; Y_1 represents a Lewis base, an alkali metal, an alkaline earth metal, a transition metal, an aluminum, an indium or a thallium; Z_1 represents an organometallic complex or a salt thereof. Among these catalysts, the organometallic complex and the salt are preferable. The organometallic complex includes the following complex compounds: (1) A complex compound represented by a formula: wherein X_4 and X_5 each independently represent a halogen atom; Y_2 represents a Lewis base, an alkali metal, an alkaline earth metal, a transition metal, an aluminum, an indium or a thallium; Z_2 represents an organometallic complex or a salt thereof. The following organometallic complexes can be used as the organometallic complex in the complex compound (1): (2) A complex compound represented by a formula: wherein X_6 and X_7 each independently represent a halogen atom; Y_3 represents a Lewis base, an alkali metal, an alkaline earth metal, a transition metal, an aluminum, an indium or a thallium; Z_3 represents an organometallic complex or a salt thereof. The following organometallic complexes can be used as the organometallic complex in the complex compound (2): (3) A complex compound represented by a formula: wherein X_8 and X_9 each independently represent a halogen atom; Y_4 represents a Lewis base, an alkali metal, an alkaline earth metal, a transition metal, an aluminum, an indium or a thallium; Z_4 represents an organometallic complex or a salt thereof. The following organometallic complexes can be used as the organometallic complex in the complex compound (3): (4) A complex compound represented by a formula: wherein X_{10} represents
