Reliability and validity of the Tool to Assess Treatment Satisfaction (TASST) among breast cancer patients. In palliative care, evaluation of treatment satisfaction is frequently assessed using the Tool to Assess Satisfaction with Treatment (TASST). This study is the first to establish the reliability and validity of the TASST among breast cancer patients. Breast cancer patients (n = 103) completed the TASST (German version) online. Concurrent validity was assessed by correlating TASST with the eudaimonic and hedonic well-being component scores of the EORTC-QLQ-C30. Concurrent validity was acceptable (all $p \le 0.05$), and the mean TASST scores showed good internal consistency ($\alpha = 0.96$; Cronbach's $\alpha = 0.95$). The internal consistency of the TASST subscales was acceptable as well, except for the EORTC-QLQ-C30 cognitive functioning subscale ($\alpha = 0.54$; Cronbach's $\alpha = 0.54$). The TASST was robust against changes in floor and ceiling effects, and the stability of the TASST over time was excellent. In addition, convergent validity and known-groups validity were acceptable. The psychometric properties of the TASST among breast cancer patients were satisfactory. The relevance of this instrument will be strengthened when healthcare professionals consider the use of the TASST in breast cancer patients receiving various treatment options.Meanwhile, the last two episodes focused heavily on Lois and Clark, and the two-part finale had one last surprise.
